

1. Firstly decide if you are fixing your blinds to the window frames or the facias of your conservatory. Ensure that your measure between the frames or between the facias as required. Always order conservatory blinds as 'Exact Size'. Your blinds will then be manufactured to the measurements you provide and will ensure that your blinds fit correctly.
2. Measure between points A and B and deduct 105mm from this measurement.
3. Measure between points C and D and deduct 10mm from this measurement.
4. Measure between points E and F (between the sill boards) and do not make a deduction from this measurement.
5. Measure between points G and H and deduct 10mm from this measurement.
6. Measure between points I and J and deduct 105mm from this measurement.
7. When measuring for the drop of the blinds, measure from where you would like the top of the bracket to finish to the sill board and deduct 10mm from this measurement. We advise that you measure in several places as the drop will vary around your conservatory and always use the smallest measurement. If measuring the drop of a door blind, remember to make an extra deduction if you are placing a door mat under your blinds.

Using this guide, the exact size measurements you give us are the finished widths of the tracks and the finished drop of the blinds from the top of the bracket to the bottom of the fabric.

## Important

Never measure existing blinds that you may have in your window when ordering a completely new set of blinds - you must measure the window as if it's a blank canvas.
